

**STORMSURE**  
Fixes almost everything!

## Important Storage Information

# Storing partly used tubes of Stormsure Flexible Repair Adhesive

**W**e advise users to store part - used tubes in the freezer. This advice is written on the instruction card and also on the tube.

The shelf life of unopened tubes is very long. I have some office samples which are over 15 years old and are perfectly useable.

Stormsure glue cures when it comes into contact with water vapour. There is enough vapour in the air to start the curing reaction. It is a chain reaction, so once it has started it carries on until it has completely cured. Sometimes a small air bubble will

be closed inside the tube and this is sufficient to start the reaction. So, before replacing the cap, squeeze the glue to the top of the tube neck.

Then screw on the cap.

Freezing the glue turns the water into ice and also makes the glue go hard and waxy which prevents the reaction from starting. To use the glue again just leave it in a warm place until it has melted and reached normal room temperature and it will work as normal.

We sell a pack of three small 5g tubes so that you can use one tube and still have two more for another day.
